COMS 4115:PROGRAMMING LANGUAGE AND TRANLATOR

CAML: COMPOSING AMAZING MUSIC LANGUAGE

May 20, 2019

Contents

1 INTRODUCTION

CAML is a simple but powerful strongly-typed programming language that aims to facilitate digital music generation. It supports first class function, structs, arrays with a static scoped C-like syntax.

1.1 Motivations

Digital audio software has become increasingly popular in recent years. Such software frees musicians om the constraints of physical instruments and provides instant feedback for any spark of inspiration and creativity.

Many digital software features a powerful GUI interface for composer to feel like writing on a music sheet. Since most complex music contains some sort of repeated pieces, many efforts are wasted on manual editing of redundant works. Also, many software of these kinds suffer from space/memory inefficiency. For example, GarageBand takes over more than 1.7GB of storage.
Our language CAML, a simple, small, but powerful tool, is designed to minimize the amount of repetitive works and enables musicians without any coding experience to compose digital music.

1.2 Characteristic of CAML

CAML provides powerful functionality including first class functions, Array manipulations, structs to help composers to focus on the structure of their scripts and produce complicated digital composition on the fly.
By manipulating the sequences of tracks and chords, composers could synthesized multiple tracks with a full range of different instruments with a simple keyboard.

1.2.1 Simple

CAML strives to simplify the syntax for musical composers and aims to serve people with no programming experience. We employ many tweaks, known as syntactic sugar, to make things easier for CAML developers to read and to express.
For instance, CAML has a universal print function that can take string, integer, bool, or pitch

as input and print the corresponding object accordingly. Another useful feature is variable can be declared and initialized in the some line. Array manipulation such as concat, multiple useful functionality in the standard library, all of which makes the CAML programmer to write less and accomplish more.

1.2.2 Extensible

CAML enables user-defined library and custom functions and structures. As music composition could use a lot of repetitive efforts, programmers could take advantage of a self-written library or a custom structure to streamline their production. CAML is platform-independent as long as a compatible LLVM, OCaml and dependencies versions are satisfied.

1.2.3 Powerful

CAML does not limit itself to music composition only. Our goal is to be able to implement a variety of complex tasks and common algorithms such as Dijkstra's algorithm, bubble-sort algorithm, and many others efficiently. The details of implementations can be found at Appendix.

2 TUTORIAL

2.1 Environment Setup

To use this language, you need to install setup the OCaml and LLVM environment on your computer. Mac users are recommended to install OCaml through Homebrew, using the following commands:

```
brew install ocaml
brew install opam
```

The next step is to install LLVM and OCaml LLVM library. LLVM can also be easily installed through H omebrew by:

```
brew install llvm
```

You need to remember where Homebrew places LLVM executables and the version of your LLVM, because the version of the OCaml LLVM library must match the version of the LLVM.

The commands to install Ocaml LLVM Library is:

```
opam install llvm.3.6
```

You may need to install its dependencies if your command line tool request you to do so.

2.2 Installation and Compilation

The source code of CAML language and its translator is available on Github:

`https://github.com/kliao4243/Caml_Project.git`

You can download this repository as a .zip file to your local device and start compiling. First enter the source directory and run **build.sh**. The script build the standard library and CAML compiler. If build failed, delete the existed **caml.native** file and compile it again. Second enter the midifile and run another **build.sh** here. It will initialize the Midifile package and build an executable **midi-generator**, which will be used to generate songs. Then you are good to write some music.
To compile code, please use the **run.sh** to generate song or print raw output:

```
run.sh -s code.cl //generate .ll file and song
run.sh -p code.cl // generate .ll file and print raw output
run.sh -o code.cl out// generate .ll file and save raw output to out
```

The output of CAML built-in generate music function is a MIDI file. To play the music you compose, you need to download a MIDI-compatible music software. Our recommendations are Guitar Pro and GarageBand. GuitarPro is available throught the link:

`https://www.guitar-pro.com/en/index.php`

GarageBand can be downloaded on Apple App Store.

3 LANGUAGE MANUAL

3.1 Primitive Types

Boolean (bool) : A value indicating true or false, such as True.

Integer (int) : A 32-bit signed integer, such as 256.

Floating point (double) : A 128-bits sequence of number with a decimal point, such as

256.652.

String (String) : A sequence of character we defined above, whose length is variable, such as 'Even KUN Cai can compose amazing music with the help of CAML' or "Even KUN Cai can compose amazing music with the help of CAML". String supports two types of escape characters '\n' (newline) and '\t' (tab).

Pitch (Pitch): A 24-bit value denoting the pitch of a note. Notes C-D-E-F-G-A-B are represented as 1, 2, 3, 4, 5, 6, 7. Natural notes, flat notes, and sharp notes are followed by ^, b, and # respectively. The octave is represented by another followed number, and 4 represents the central octave. For example, 1^4 represents Middle C (C4), or MIDI note number 60, frequency 261.63 Hz.

3.2 Array

An `Array` is a set of objects of the same type enclosed in square brackets. Elements in an array are divided by commas. Type of an array must be specified during variable declaration. Array supports indexing and concatenation. An array looks like the following

```
int[5] int_array = [1, 2, 3, 4, 5]
int_array = int_array @ [6,7] /* int_array = [1, 2, 3, 4, 5, 6, 7]*/
pitch[4] song = [1^4, 2^4, 3^4, 4^4] /* pitch array*/
int[5] nested = [[1,2,3],[2,3],[3],[4],[5,6]]// nested array is supported
```

Like most languages, all elements in one array must be of the same data type. The following is an example of a illegal array:

```
int[6] int_array = [1, 2, 3, 4, 5, 'Amazing']
```

One thing worth noting is that assigning a pre-defined Array to a new Array doesn't create a new Array but points the second array to the same address of the same element. To create a copy of the same Array, one should use the concatenation operator with an empty Array. For more details, check section 3.8 Array Operator.

```
int[4] int_array = [1, 2, 3, 4];
int[4] new_int_array = int_array; /* this points to the same address*/
new_int_array[0] = 10; /* int_array = [10, 2, 3, 4]*/
int[4] new_int_array = int_array@[]; /* this copies the array */
```

```
new_int_array[0] = 1000; /* int_array = [10, 2, 3, 4]*/ remained unchanged
```

3.3 User Defined Type (Struct)

User-defined type is supported in CAML. Users can define a data type that is not included in the standard library by using the keyword **struct**. The name of a new struct has to start with underscore _. The member field of a struct can contain several variable s of any primitive data types. An array of primitive data type can also be a member of a struct. The following is an example of defining a new struct:

```
struct _demoNote = {
    String Artist;
    Pitch demo;
};
```

Once a struct is defined, it can be used just as other system defined data type. Variables inside a struct can be accessed by using member access operator **(.)**. The following is a legal example of creating a user defined type object and modifying this object:

```
_demoNote practice;
practice.Artist = "Hanon";
practice.demo = 4^4;
```

3.4 Track

In our definition, a song is the combination of one or multiple tracks. `Track` is a system-defined complex struct consisting of a melody array, a rhythm array, size and instrument. Pitch and rhythm array carry the information of every note in this track. The code for instrument can be found in **instrument-reference.txt**. The following is an example of a valid track:

```
_track twinkle;
twinkle.melody = {4^4, 4^4, 5^4, 5^4};
twinkle.rhythm = [1, 1, 1, 2];
twinkle.size = 4;
twinkle.instrument = 1 /*Piano*/
```

A `Track` can also be built by built-in function:

```
_track t = build_track(1,4,{4^4, 4^4, 5^4, 5^4},[1, 1, 1, 2]);
```

3.5 Variables and Assignment

CAML is a strongly-typed language. Types of variables are predefined and cannot be inferred to other types. Certain operators are allowable only with certain data types. `=` is used to assign value to an identifier:

```
int one = 1;
int two = 1+1;
String s = "hello world";
Pitch c = 1^4;
Pitch c_sharp = 1#4;
Pitch[7] star = {1^4, 1^4, 5^4, 5^4, 6^4, 6^4, 5^4};
int[4] arr = [1,2,3,4];
```

3.6 Arithmetic Operators

CAML supports arithmetic operators +, -, *, /. The unary - operator has the highest precedence, followed by the binary *, /, followed by the binary + and - operators. All arithmetic operators are left-associative. Arithmetic operators cannot be applied to different types of operands. For example,

```
int a = 1 + 1; /* valid */
int a = 2 + 0.5; /* invalid */
```

3.7 Logical Operators

Logical operators include `==`, `!=` , `<=`, `>=`, `<`, `>` and keywords `and`, `or`. `<=`, `>=`, `<`, `>` have the highest precedence, followed by `==`, `!=`, followed by `and`, `or`. In equality comparison, primitives are compared by value. Note that most logical operators don't support for `Pitch`.

```
bool test = 1 == 1; /* return True */
Pitch c_sharp = 1#4;
```

```
Pitch d_flat = 2b4;
bool a = c_sharp == d_flat; /* syntax error */
```

3.8 Array Operator

We have two array special operator: @, which stands for concatenation, and [], which is used to access an element by index. The concatenation operator takes either two pre-defined Array or a temporary Array literal and create a new Array of the same type with the combined set of elements. Note that array concatenation creates another array instead of just copying over the pointer, unlike the assign operator, which is much more expensive and should be used with caution on large arrays.

```
int[3] Arr = [1,2,3];
int[6] Arr2 = Arr @ Arr; /* Arr2 = [1,2,3,1,2,3]*/
int[6] Arr3 = Arr @ [1,2,3]; /* Arr3 = [1,2,3,1,2,3]*/
Arr3[2] = 30; /* This would not affect Arr*/
Arr[2] = Arr3[2]; /* This would affect Arr*/
```

3.9 Comments

/**/ is the comment symbol.

```
/* This is a comment */
```

3.10 Conditional Statements

$$conditional\ expr \rightarrow \textbf{if}\ condition\textbf{:}\ do\ something$$

$$[\textbf{else:}do\ something\ else]^*$$

Each expression after an if statement should be an expression that evaluates to a boolean that is either true or false. The else statement following the if is optional.
If the expression evaluates to true then the expression indented following the subsequent colon is executed. Otherwise, in the case there's an else statement, the expression indented following the colon after else is executed.

In the case of nested if statements, then the else binds to the if block with the same indentation. Parentheses around the conditional statements are optional. As the example shown below:

```
A = 3;
B = 4;
if (A > 0){ /* this is the first if statement */
    if (B > 0){ /* this is the second if statement*/
        B = B+5;}
else: {/* this else matches the first if statement*/
    B = B-5;}
    }
```

3.11 loop Statements

$$loops expr \rightarrow \textbf{while}\, condition\textbf{:}\, do something$$

$$[break/continue]^*$$

Each expression after an if statement should be an expression that evaluates to a boolean that is either true or false. If the expression evaluates to true then the expression indented following the subsequent colon is executed.
In the case of a break statement, we break out of the while loops and continue executing the program afterwards. In the case of a continue statement, we skip the current iteration and start the next iteration immediately.
In the case of nested while statements, then any break or continue binds to the while block with the preceding indentation. As the example shown below:

```
i = 0;
j = 0;
sum = 0;
while (i < 10){ /* this is the first while statement*/
    while (j < 5){ /*this is the second while statement*/
        sum = sum+j;
        if (j % 3 == 0){
            break;} /*this break matches the second while*/
    i = i+1;
```

```
    if (i == 5){
        continue; /*this continue the first while and start from i*/ = i+1}}
    sum = sum + i}
```

While loops can be very helpful in repeating the same rhyme and tracks multiple times.

3.12 Module

A program must declare the module it needs to import using **#include** keyword at its beginning. Once import a module, a program can use any functions and user defined types in that module. The following is a valid example of using a module:

```
/*This is song.cl*/
struct _song = {
    String name;
    int rating;
};
```

```
/*This is another file*/
#include "src/stdlib.cl";
#include "song.cl";

_song demoSong;
demoSong.name = "The Entertainer";
demoSong.rating = 5;
```

3.13 Function

The function is defined by a **def** keyword, and the control flow inside a function is also determined by indentation. The return type of a function must be specified before the def keyword, and the types of argument also need to be specified when defining a function. The following is a legal function definition example:

```
int def add_one(int input):
    return input+1
```

3.14 Scope

The scope of a name binding, such as a user defined type or a variable, is region of a program where the binding is valid. Such a region is referred to as a scope block. Outside the scope block of a variable, the name may refer to a different entity (it may have a different binding), or to nothing at all (it may be unbound).

In CAML, the scoping policy is natural and very similar to other prevalent programming languages such as Python and Java. A variable's scope block is basically the continuous space inside the same braces as this variable. In the example below:

```
int i=0

int print_one(){
    int i = 1;
    print(i);
}

print_one();
print(i);
```

The program prints 1 and then prints 0. The scope block of the variable i inside the print_one function is all space inside the program. The scope block of the variable i outside the print_one function is the whole program except the print_one function.

3.15 STL

Our standard library is written both in C and CAML. It provides built-in functions for covert-ing pitch, building track and generating songs. The built-in struct type **Track** is also declared in STL.

```
int pitch_to_int(pitch x);
void generate_music(_track x);
_track build_track(int instrument, int size, pitch[] melody, int[] rhythm);
int ran(int range);
```

To convert the user input pitches into readable integers for midi generator, `pitch_to_int` translates pitch to integer through this graph.

Note	Octave										
	-1	0	1	2	3	4	5	6	7	8	9
C	0	12	24	36	48	**60**	72	84	96	108	120
C#	1	13	25	37	49	**61**	73	85	97	109	121
D	2	14	26	38	50	**62**	74	86	98	110	122
D#	3	15	27	39	51	**63**	75	87	99	111	123
E	4	16	28	40	52	**64**	76	88	100	112	124
F	5	17	29	41	53	**65**	77	89	101	113	125
F#	6	18	30	42	54	**66**	78	90	102	114	126
G	7	19	31	43	55	**67**	79	91	103	115	127
G#	8	20	32	44	56	**68**	80	92	104	116	
A	9	21	33	45	57	**69**	81	93	105	117	
A#	10	22	34	46	58	**70**	82	94	106	118	
B	11	23	35	47	59	**71**	83	95	107	119	

`build_track` serves as a constructor for tracks. It takes member variables as input and return the corresponding track. The maximum size for a track is 50.
`generate_music` is used to generate our standard format output for midi generator. It should be call at the end of program. Calling this function more than once means adding more than one track into the song. The output would automatically merge tracks and come out with a song with multiple parallel tracks.

3.16 Program Structure

A CAML program is may exist entirely within a single source file, but more commonly, programs that aiming at composing will consist of the standard library, and will also link with files from existing files. For example, an sample program for twinkle twinkle little star:

```
#include "src/stdlib.cl";
int main()
{
   int i;
   int a;
   _track track;
   Pitch[7] first = [1^4,1^4,5^4,5^4,6^4,6^4,5^4];
    Pitch[7] second = [4^4,4^4,3^4,3^4,2^4,2^4,1^4];
    Pitch[14] total = first@second;
   int[] rhythm = [4,4,4,4,4,4,2,4,4,4,4,4,4,2];
```

```
    track = build_track(1, 14, total, rhythm);
    generate_music(track);
    return 0;
}
```

The compiler first loads functions and structs in the included files that declared on the top of program, then it will load the other functions or structs that defined in the current program. Compiler will try to find `main` function and execute the code in its block. Users can create whatever note they want by defining the melody and rhythm array. Note that melody array and rhythm array should have the same lengths. After finished track building users need to call `generate_music` to generate standard output for midi generator before return.

4 PROJECT PLAN

4.1 Planning and Development Process

We submitted the draft of language reference manual on March 6th and begin planning on the implementation of the whole project.

We began to have a rigorous and detailed plan after the spring break. Before the due date of the first Hello World assignment, we had several times of discussion about what programming language features we must support to enable CAML to compose real songs. Before the end of March, we determined that pitch data type, array, and struct are the most element functionalities of CAML. They are crucial to represent a song.

On April 9th, we finished the implementation of array and string print (Hello World). After that, Our team generally meet once or twice a week depending on everyone's schedule. Most of the meetings happen on Wednesday and Thursday. Our work style was to stay and work together for several hours, and solved the problems and bugs during meetings unless it was identified as very easy to tackle.

User defined type was a challenging feature to develop and took us lots of time. We finished the scanner, parser, ast, semantic check, sast in two meetings, and spent another two meetings to implement the code generation. The struct was finished on April 30th.

During the last two weeks before final demonstration, we spent significantly more time on this project. We finished the music related part of this project, including linking C standard library, generating MIDI files before May 10th. And we developed more useful built-in func-

tions, and added other functionalities in the translator like improving array concatenation before the final presentation.

4.2 Programming Style Guide

As mentioned, our team typically work together, and had very smooth communication and punctual feedback. For these reasons, we did not have very specific rules on programming style, However, we were well-coordinated to follow some unspecified rules, like add one tab of indentation after each let command in OCaml, use the same naming convention as MicroC, etc.

4.3 Project Timeline

March 31th	Hello World worked
April 7th	Add primitive data type pitch
April 9th	Array worked
April 17th	Struct can output SAST
April 19th	Integrate print function
April 21th	Funtion can take array as input
April 30th	Struct worked
May 1st	Arrays can be concatenated
May 3rd	Can import modules and standard library
May 5th	Caml standard library finished
May 6th	C standard library finished
May 10th	Can generate MIDI file
May 15th	Final version after lots of small adjustment

4.4 Roles and Responsibilities of Each member

Name	Role	Responsibilities
Yuanji Huang	System Architect, Tester	struct, variable assignment, c standard library, caml standard library, midi file generation, testing
Kunjian Liao	Manager, Tester	pitch, struct, include, caml standard library, testing
Yipeng Zhang	Language Guru	array, combine print function, array concatenation, array size function, testing

4.5 Language and Environment

We used Sublime as text editor and ran the code on Mac Terminal. We developed on OCaml for more than 90% of time. We wrote a standard library in C to support music generation, we also used C++ to generate a executable file to get access to MIDI library.

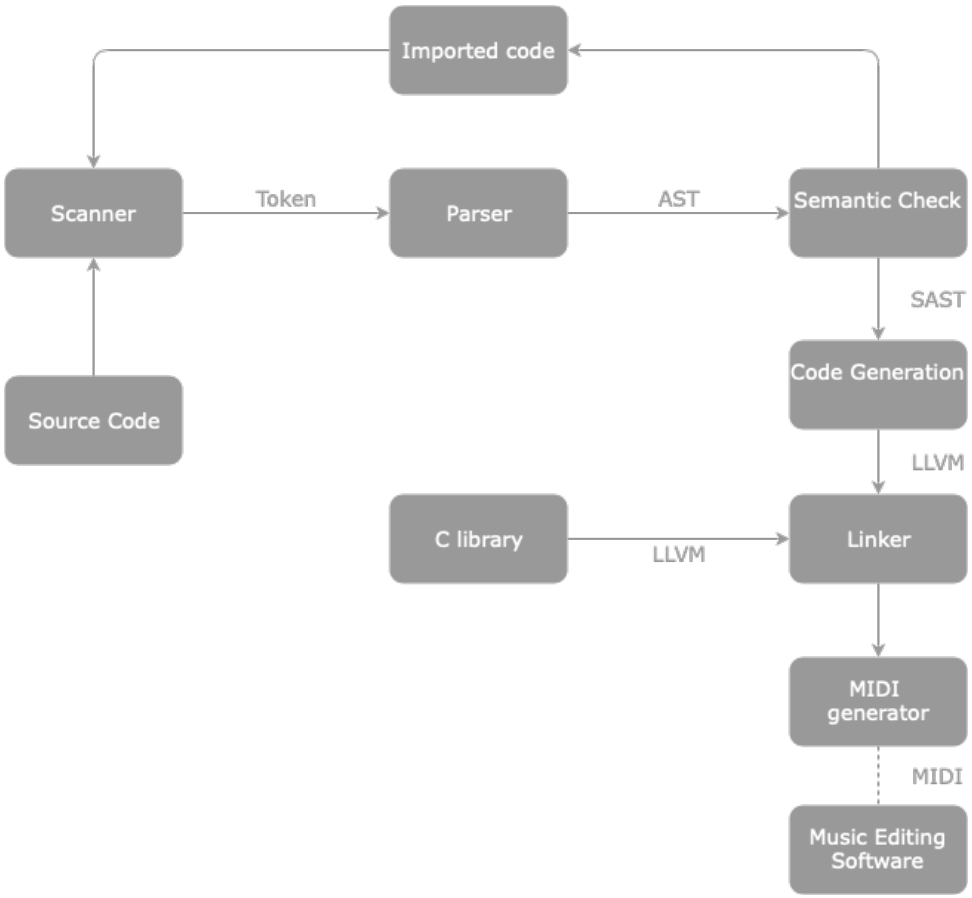
5 ARCHITECTURAL DESIGN

5.1 System Block Diagram

CAML compiler follows a sequence of process to transform source code into a midi file, including lexical analysis, syntax analysis, semantic checking, IR generation, machine code generation and midi generation.



5.2 Lexical Analysis

In lexical analysis phase, scanner scans the source code as a stream of characters and converts it into tokens. If any illegal characters are detected, scanner will throw lexical exceptions. Note that characters in comment are not scanned. This part is done by Yipeng and Kunjian.

5.3 Syntax Analysis

The next phase is the parsing phase. It takes the token produced by lexical analysis as input and generates an abstract syntax tree. In CAML, program is a list of declarations, while declaration can be function, variable or struct declaration. One of CAML special design in parser is when Array is declared, user can choose to define the size or use default value. The size information will be carried by token `Array` and makes it easier for Array concatenation and iteration. This part is done by Yipeng and Kunjian.

5.4 Semantic Checking

In this phase, compiler will traverse the AST and generate SAST. Standard library is also added in this phase: if token `include` is found in program, compiler will try to open the included file, go through all phases before and attach the included AST before current AST. Compiler also adds declarations of build-in function that written in C into symbol table in this phase, otherwise program cannot pass semantic checking when calling build-in functions. This part is done by Yuanji, Yipeng and Kunjian.

5.5 IR generation

In this last front-end phase, the compiler generates LLVM code of the source code for the target machine. Except for the primitive types such as integer and float, types like array and struct are pointer actually. The most challenging thing here is how to use limited LLVM methods to implement Array concatenation. Our solution is to define a new pointer, fetch each element in these two arrays by for loop, and assign it to the new pointer one by one. But if someone try to concatenate multiple arrays at one time:

```
int[8] a = [1,2]@[2,3]@[3,4]@[4,5];
```

When handling the second and the following '@', the compiler has to concatenate the processed arrays again instead of using stored results. That makes multiple array concatenation a memory-consuming operation. This part is done by Yuanji and Yipeng.

5.6 Machine code generation

In this phase C standard library is linked to the program and executable file is generated. By executing this file, standard format output is stored and read by midi generator. This part is done by Yuanji.

5.7 Midi generation

CAML utilizes C++ library Midifile to generate .mid file. .mid file can be open with GarageBand or Guitar Pro. This part is done by Yuanji.

6 TEST PLAN

We have two separate test suites for our language and newly implemented features: unit test and integration test. In unit test, we make sure each piece of the codes was correctly implemented and achieved exactly what we expected. In integration test, we combined functionality to check if features work well with each other. For most or part of the functionalities, we divide our testing responsibility into the following:
Kunjian Liao: struct, include
Yuanji Huang: stdlib.c, stdlib.cl
Yipeng Zhang: array, pointer, operators
General(all): if, for, while, ifelse, function

6.1 Unit Test

The followings are the test cases and the final output (.exe output).

Test: print int

```
/* author: Yuanji Huang */
int main(){
    print(123);
}
```

```
123
```

Test: print float

```
/* author: Yuanji Huang */
int main(){
    print(123.2);
```

```
}
```

```
123.2
```

Test: print string

```
/* author: Yuanji Huang */
int main(){
    print("helloworld");
}
```

```
helloworld
```

Test: print pitch

```
/* author: Yuanji Huang */
int main(){
    print(4^4);
    print(5#4);
    print(4b4);
}
```

```
4^4
5#4
4b4
```

Test: assign int

```
/* author: Yuanji Huang */
int main(){
    int b;
    int a = 1;
    b = 2;
    print(a);
```

```
    print(b);
}
```

```
1
2
```

Test: assign float

```
/* author: Yuanji Huang */
int main(){
    float b;
    float a = 1.1;
    b = 2.23;
    print(a);
    print(b);
}
```

```
1.1
2.23
```

Test: assign string

```
/* author: Yuanji Huang */
int main(){
    String a = "helloworld";
    print(a);
}
```

```
helloworld
```

Test: assign pitch

```
/* author: Yuanji Huang */
int main(){
```

```
    Pitch a = 2b4;
    Pitch b = 3^7;
    Pitch c = 4#5;
    print(a);
    print(b);
    print(c);
}
```

```
2b4
3^7
4#5
```

Test: build track

```
/* author: Yuanji Huang */
#include "src/stdlib.cl";
int main(){
    _track t;
    t = build_track(1,2,[4b4,4#4],[4,4]);
    print(t.size);
    print(t.instrument);
    print(t.melody[0]);
    print(t.rhythm[0]);
    print(t.melody[1]);
    print(t.rhythm[1]);
}
```

```
2
1
4b4
4
4#4
4
```

Test: generate music

```
/* author: Yuanji Huang */
#include "src/stdlib.cl";
int main(){
    _track t;
    t = build_track(1,2,[4b4,4#4],[4,4]);
    generate_music(t);
}
```

```
track_start
1
2
64
4
66
4
```

Test: struct with single member

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
struct _test{
    int test;
};
int main(){
   _test a;
   a.test = 1;
   print(a.test);
}
```

```
1
```

Test: struct with multiple members

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
```

```
struct _test{
    int test;
    String test2;
};
int main(){
   _test a;
   a.test = 1;
   a.test2 = "Hello World";
   print(a.test);
   print(a.test2);
}
```

```
1
Hello World
```

Test: struct with pitch member

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
struct _test{
    Pitch test;
};
int main(){
   _test a;
   a.test = 1^4;
   print(a.test);
}
```

```
1^4
```

Test: struct with pitch array

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
struct _test{
```

```
    Pitch[] test;
};
int main(){
   _test a;
   a.test = [1^4, 1#4];
   print(a.test[0]);
}
```

```
1^4
```

Test: Struct with multiple arrays

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
struct _test{
    Pitch[] test;
    int[] test2;
};
int main(){
   _test a;
   a.test = [1^4, 1#4];
   a.test2 = [1, 2, 3];
   print(a.test[0]);
   print(a.test2[0]);
}
```

```
1^4
1
```

Test: Include struct from external file

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
struct _test{
    Pitch test;
```

```
    int test1;
};
```

```
/*Kunjian Liao*/
#include "test_kj/include_struct_helper.cl";
int main(){
   _test a;
   a.test = 1^4;
   print(a.test);
}
```

```
1^4
```

Test: Include function from external file

```
/*Kunjian Liao*/
#include "src/stdlib.cl";
int add(int a, int b){
   int x = a+b;
   return x;
}
```

```
/*Kunjian Liao*/
#include "test_kj/include_function_helper.cl";
int main(){
   int a = 1;
   int b = 2;
   int x = add(a,b);
   print(x);
   return 0;
}
```

```
3
```

Test: Array operation with different object

```
int main(){
   int[4] int_array = [1,2,3,4];
   bool[4] bool_array = [true,false,true,false];

7 LESSONS LEARNED

Yipeng Zhang: I think the most important lesson for me is how hard it is to design a complex programming language like C++ or python. Every tiny bit of convenience for the programmer could take dozens of hours of works on the compilers side, as little as an array access function. Huge respect for them who contributed behind the curtain.
Another lesson for me is the importance of team work and communication. I have twisted my heads around how to accommodate the variable declaration and assignments which is take as granted by most modern programming language. It's very hard to change the whole structure from ast to codegen and I have always wanted to take some shortcut. Until Yuanji and Kunjian helped me with this and we fixed this problem by updating as little as possible,

the bind declaration in ast. We fixed this issue in a few hours which has entangled me for more than a week. Team work is really useful in such a project and I love my team!

Yuanji Huang: Never takes the convenience features of modern programming language as granted! When I wrote down some fancy features in proposal, I have never thought that I will spend several hours on writing a simple get size function... Type inference, indent block, prompt and other common features in Python could be very hard to implement. Another lesson I learn is never try to move things that should be done in later stage to semantic checking, otherwise you will counter with causal issues. For example, we used to try updating array size in symbol table during sematic checking, but unfortunately array size would change during program execution. I also have a deep understanding in LLVM. Before this class, I have no idea what is LLVM but with this project I understand the mechanism of how LLVM build IR code and how it transform to executable file.

Kunjian Liao: One significant change happened on me after finishing this project is that I began to cherish all the features and functionalities that current high-level programming languages offer. When I transited from C++ to Python a few years ago, I was confused about why the inventor of C++ made many troublesome rules, like I have to specify the size of an array when declare it, the use of pointers, etc. Now, I begin to understand how difficult to implement features seemingly intuitive, such as type inference, flexible array. In this project, even keeping track of the size of arrays took us tons of time. Also, I now understand how the programming languages are understood by computer, which may help me improve my programming skills.
Another award that I did not expect is that I picked up my piano skills again. I stopped playing piano nearly one decade ago. During this period working on this music composing programming language project, I learnt much music theory, and listened dozens of classical music written by Chopin, Bach, Mozart, etc. This experience triggered my passion on piano, and now I practice the piano an hour a day.
